Make Thursday’s review safe to show.

Harbor Ridge Wealth is an RIA. Two households were connected last week. Their lead advisor has a quarterly review with both households on Thursday, and he does not trust the document list or the numbers. He will not put this book in front of a client until it ties: the values on the account statements, the capital calls, and the distributions have to reconcile with each other.

Your job

You are the product manager. Attached is `harbor_ridge_book.csv`, the extracted document index the product has today. You do not have the PDFs. The people are fictional. The index is a sample book we use internally.

Prepare a presentation of no more than eight slides. You will present it for twenty minutes, then we will spend twenty-five minutes working through it with you. Send the deck the day before.

The deck has three parts. For each part, tell us what you would build first, what you would leave for later and why, and how you would frame the work to the engineering team: what you would ask them to build, what they need to get right, and what you would not let them spend time on.

1. **Finding the gaps.** How Bridge would take in a book like this and find what does not tie. Name the checks you would run. Show them working on this file: for each check, cite the `row_id`s that fail it and say what the client would get wrong if a failed row reached them. Five to eight checks is enough. We care more that the checks are the right ones than that you find every row.
2. **The advisor’s review.** The screen and the flow the advisor uses to review and resolve what Bridge found, so that he can get the book ready himself. Say what Bridge resolves on its own, what it asks him to confirm, what he can override and how that override is recorded, and what he cannot change. One sketch of the screen is enough.
3. **The client’s report.** What the end client receives once the advisor is done. Say what is shown, what is hidden or marked as pending, and what guarantees that nothing reaches the client that the advisor has not cleared.

The file

338 rows. One row is one document. A household can invest through more than one legal entity, and the same fund can show up for more than one entity. Money columns are filled only when that document carried those figures.

Column	Meaning
`row_id`	Stable id. Cite these in the deck.
`portal`	Portal associated with the document. Some rows have none.
`client`	Name the advisor uses for the household.
`investing_entity`	Legal entity that holds the position.
`manager`	Fund manager that issued the document.
`fund`	Legal name of the fund.
`file_name`	File name as stored.
`document_type`	How the document was classified.
`effective_date`	As-of date on a statement, or the due date on a capital call. On any other document, the document’s own date.
`posted_date`	Date the document was issued.
`commitment`	Commitment, when the document carries one.
`contributed`	Capital contributed, when the document carries it.
`total_value`	Reported value, when the document carries it.
`cumulative_distributions`	Distributions to date, when the document carries them.
`cash_amount`	Cash on a capital call or distribution notice. Negative means the investor pays in. Positive means cash paid out. Blank on every other document type.

How to work

Plan on about three hours, and stop there. We would rather see a finished three-hour deck than a longer one that ran out of time. You may use AI. If something in the file is ambiguous, state the assumption on the slide and keep going.

Please don’t publish the file.
